

# A Meta-analysis of Recidivism Rates Among Individuals Who Commit Child Sexual Exploitation Material (CSEM) Offending

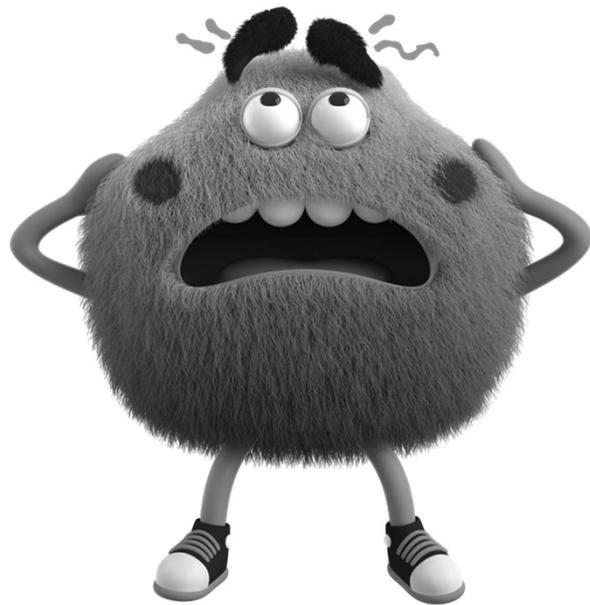

Serra Baskurt, Kelly M. Babchishin, & Michael C. Seto

February 3, 2026

# People Keep Publishing Relevant Work

# Feeling overwhelmed?

# Purpose

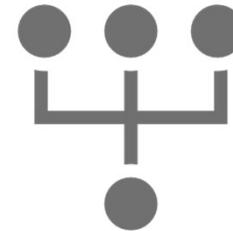

A meta-analysis of recidivism rates among individuals who commit child sexual exploitation material (CSEM) offending<sup>☆</sup>

Serra Baskurt<sup>a</sup>, Kelly M. Babchishin<sup>a,\*</sup>, Gabriella Hilkes<sup>a</sup>, Michael C. Seto<sup>b</sup>

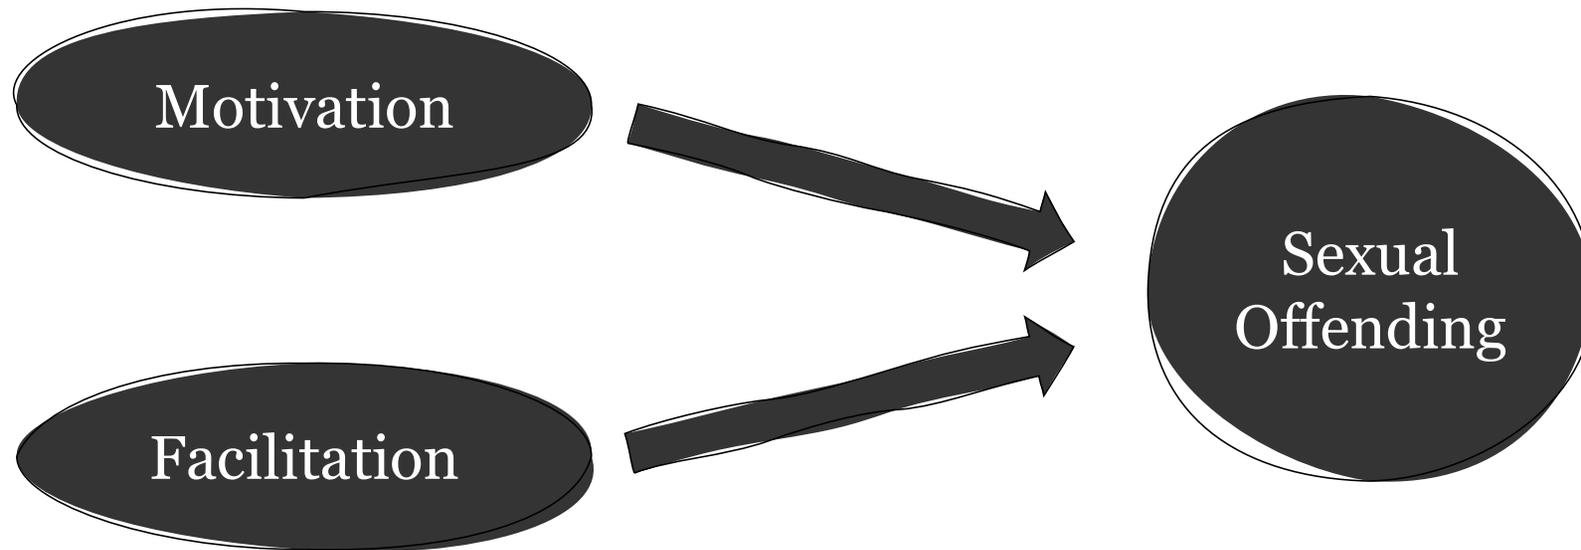

Summarizing recidivism rates  
of individuals committed  
CSEM offences

Examining moderators

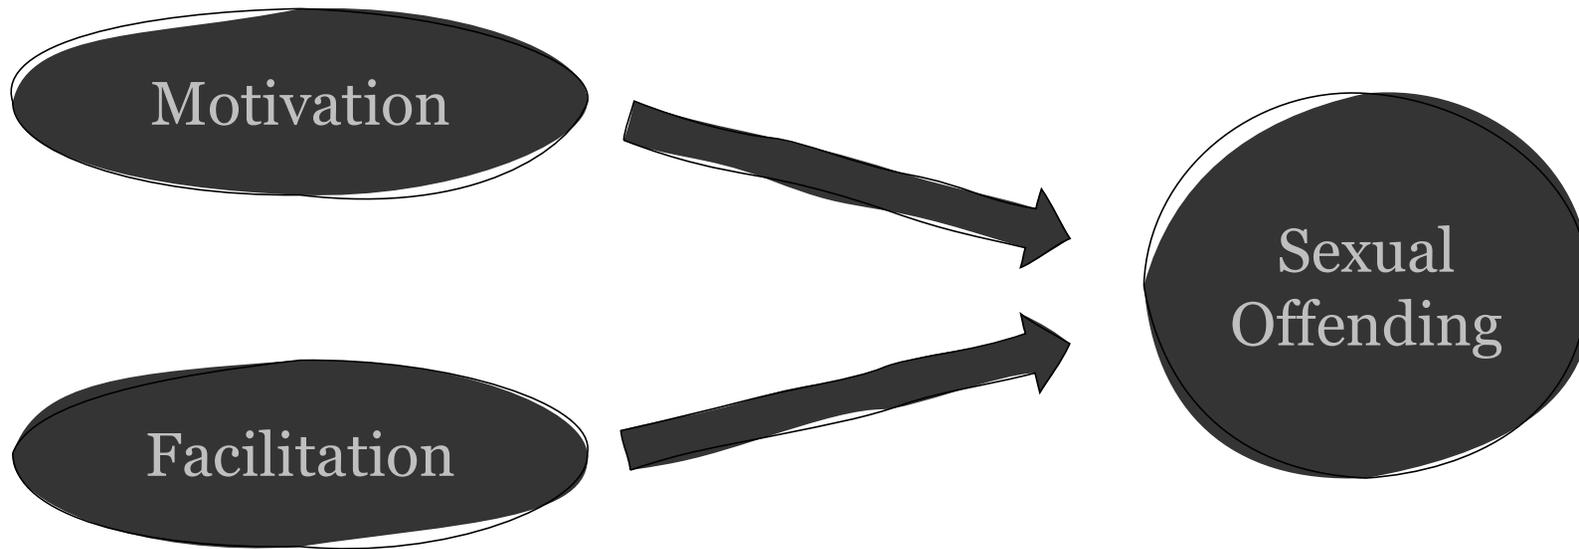

# Quick Theory 101

*Seto (2018). Motivation-Facilitation Model of Sexual Offending*

- ✓ Sexual interest in children
- ✓ Problems in sexual domains

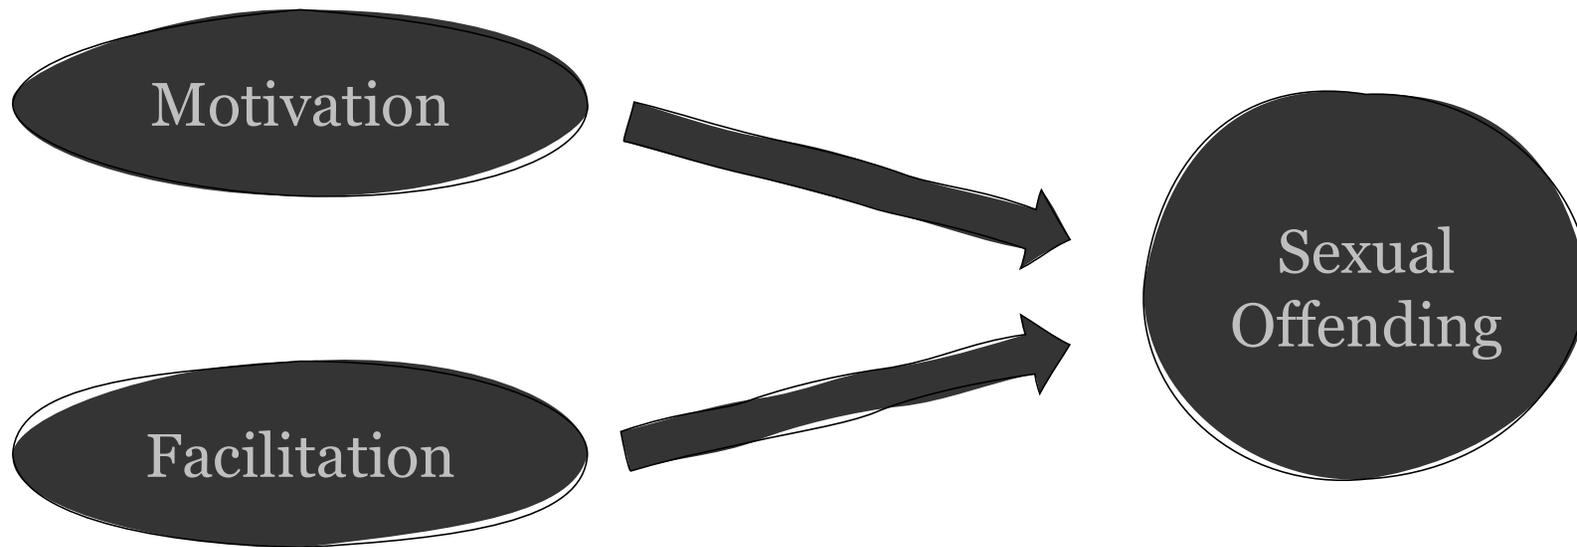

- ✗ Antisocial tendencies
- ✗ Attitudes tolerant of crime
- ✗ Access to children

Source: Babchishin et al., 2015, 2018

# MIXED

- ✓ Sexual interest in children
- ✓ Problems in sexual domains

- ✓ Antisocial tendencies
- ✓ Attitudes tolerant of crime
- ✓ Access to children

Source: Babchishin et al., 2015, 2018

## **Recidivism Rates of men with CSEM offences**

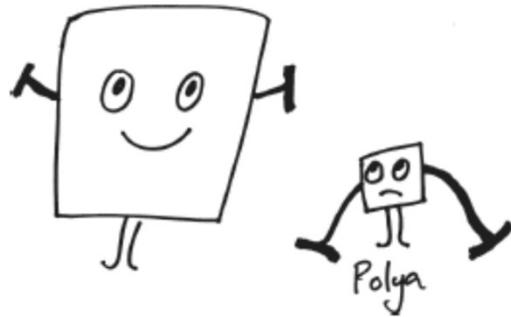

Past meta (Seto et al., 2011):

- Short follow-up
- Did not separate mixed from exclusively CSEM offending individuals

Time for an update

# What is a meta-analysis?

- A statistical technique for combining individual effects reported in studies addressing the same research question
- Output:
  - Produces a summary effect
  - Measures the variability between the individual studies

# Why Should We Conduct Meta-Analyses?

- Objective test for consistency in findings
- Provides a more objective review compared to the narrative review
- More statistical power than a study
- Can look at moderator variables
- Useful tool to influence future research as well as inform policy
- Follows iterative approach to knowledge building

# Today's talk

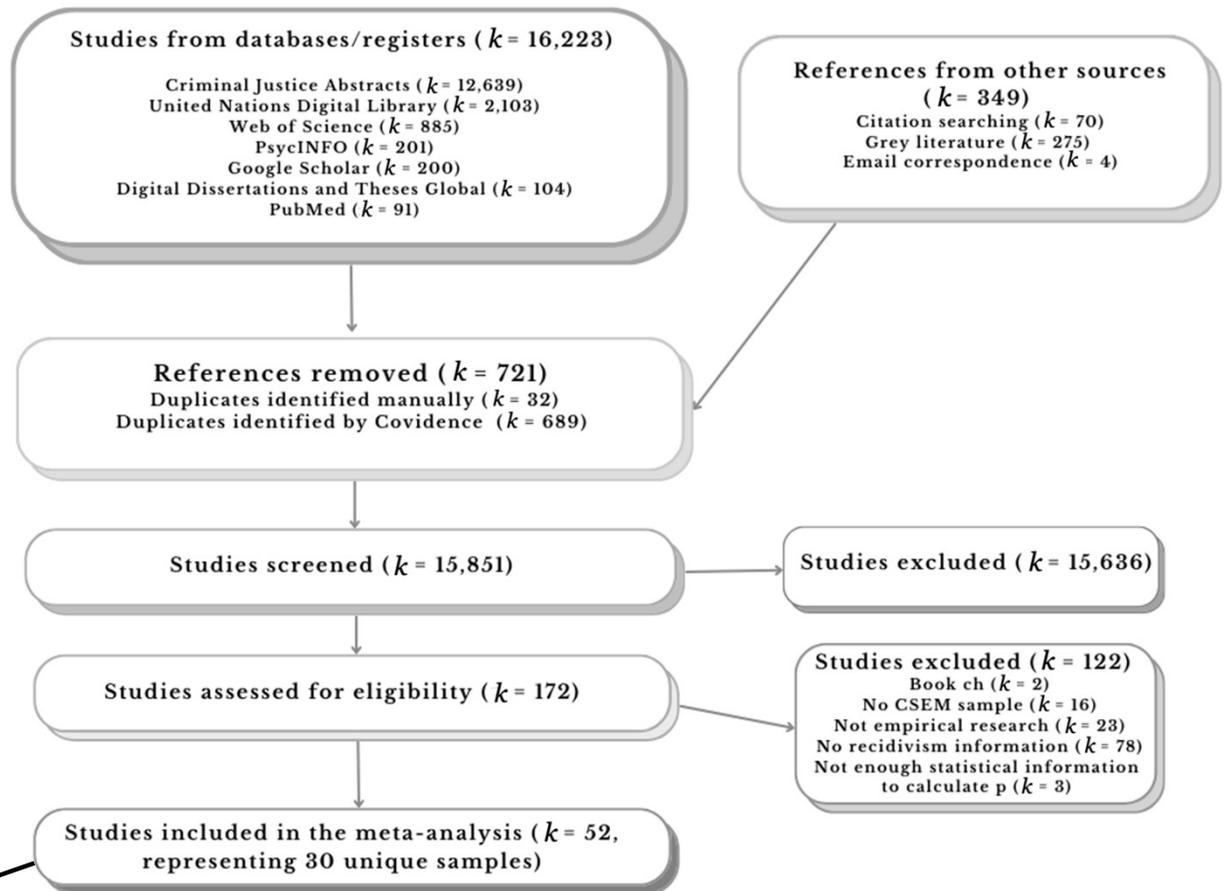

- Summarize:
  - What we did
  - What we found
  - General implications
  - Answer questions

A meta-analysis of recidivism rates among individuals who commit child sexual exploitation material (CSEM) offending<sup>☆</sup>

Serra Baskurt<sup>a</sup>, Kelly M. Babchishin<sup>a,\*</sup>, Gabriella Hilkes<sup>a</sup>, Michael C. Seto<sup>b</sup>

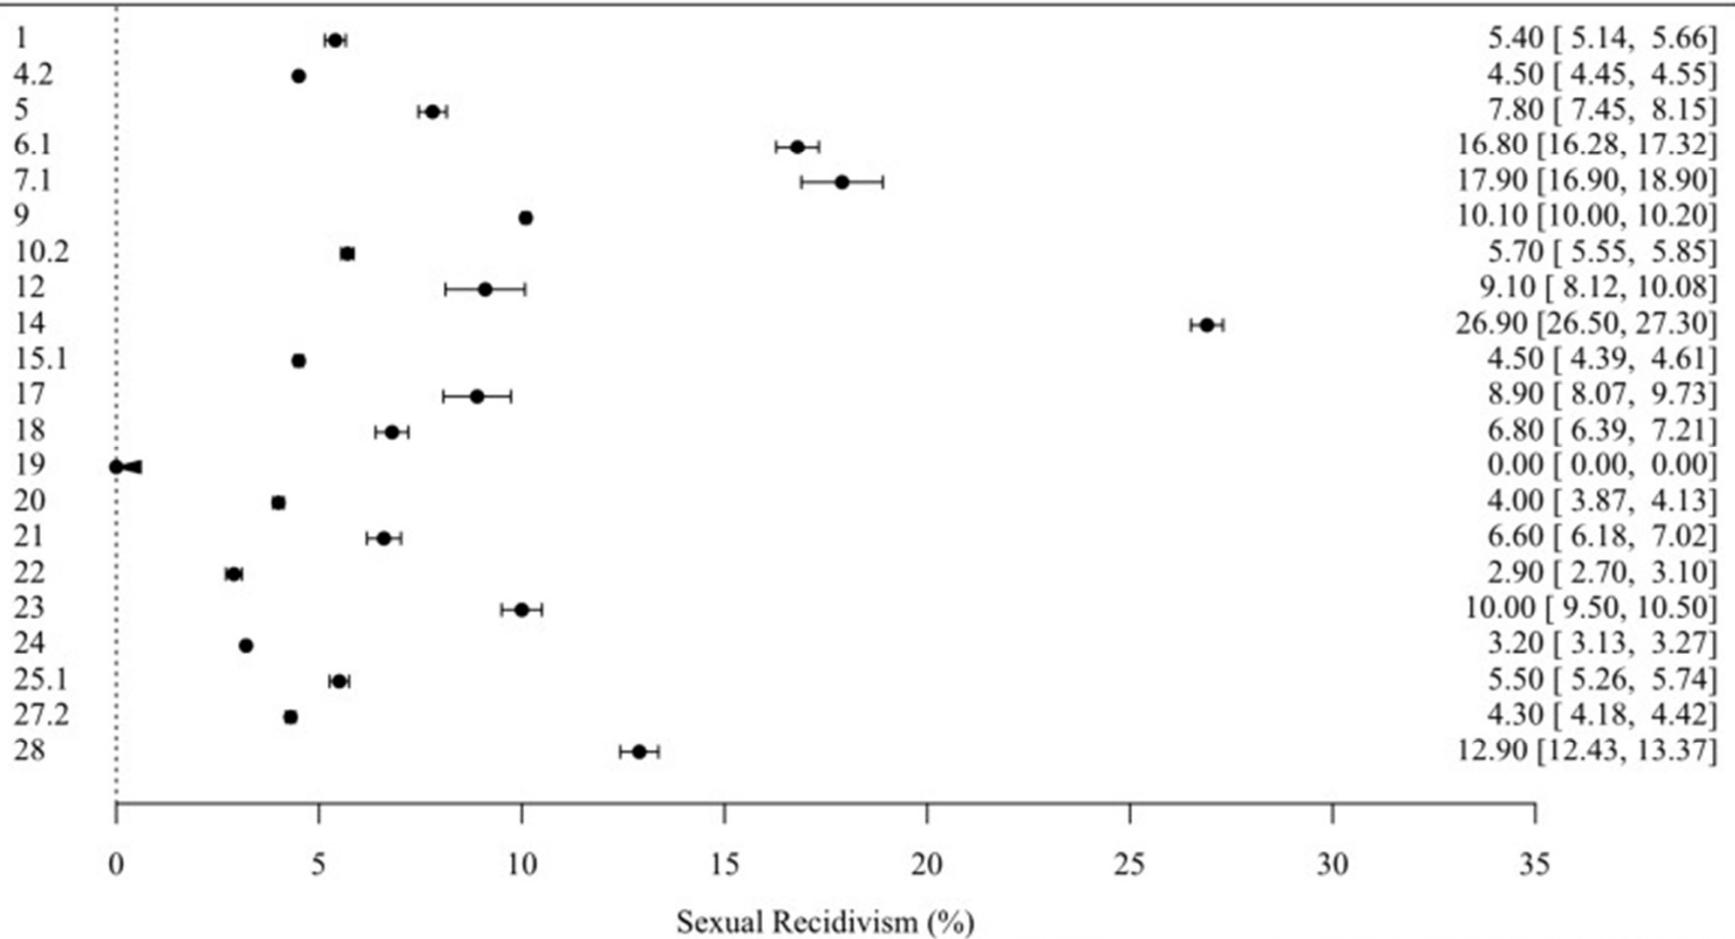

# Study Flow Chart

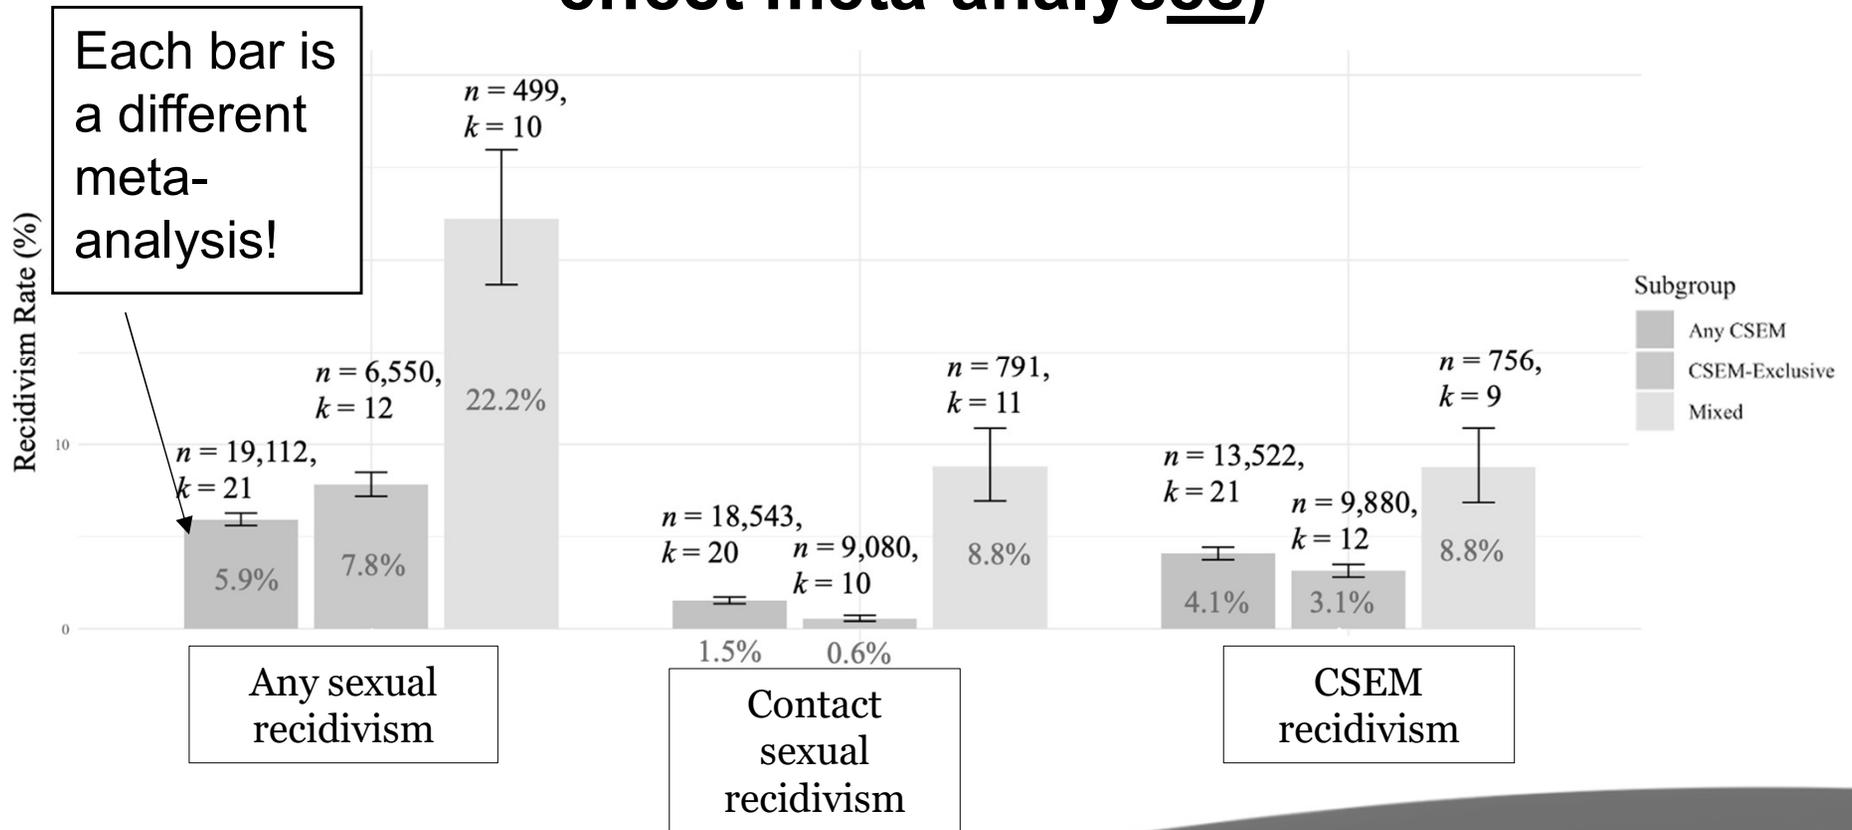

Any CSEM  $N = 19,112$   
 CSEM-E  $N = 8,272$   
 Mixed  $N = 6,267$

Forest Plot of Sexual Recidivism of Any CSEM Group

Estimate [95% CI]

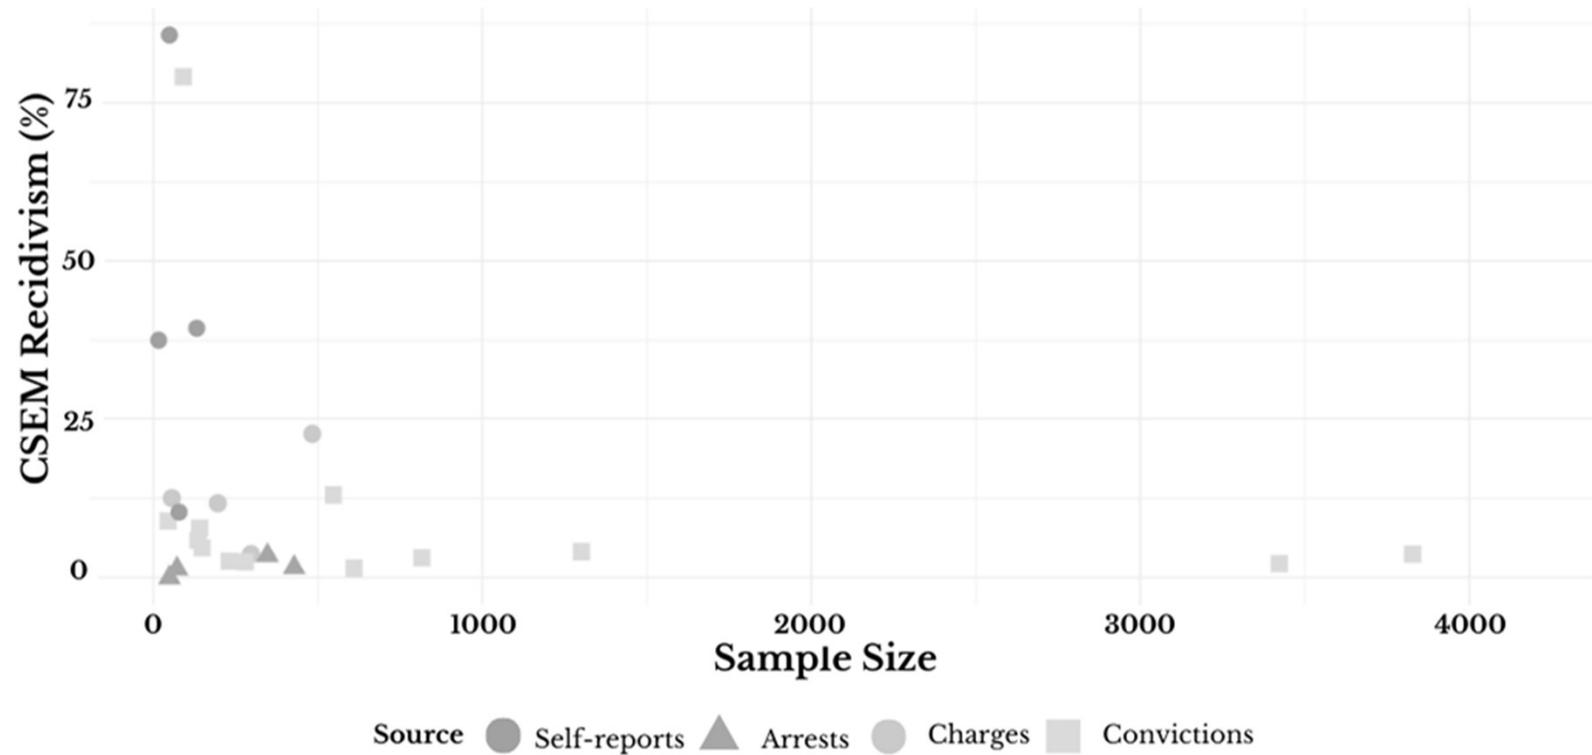

# Official (i.e., criminal record) Recidivism Rates (fixed effect meta-analyses)

Baskurt et al. (2025). Percentages reflect fixed-effect meta-analysis, average follow-up 4.8 years

# CSEM Recidivism by Source

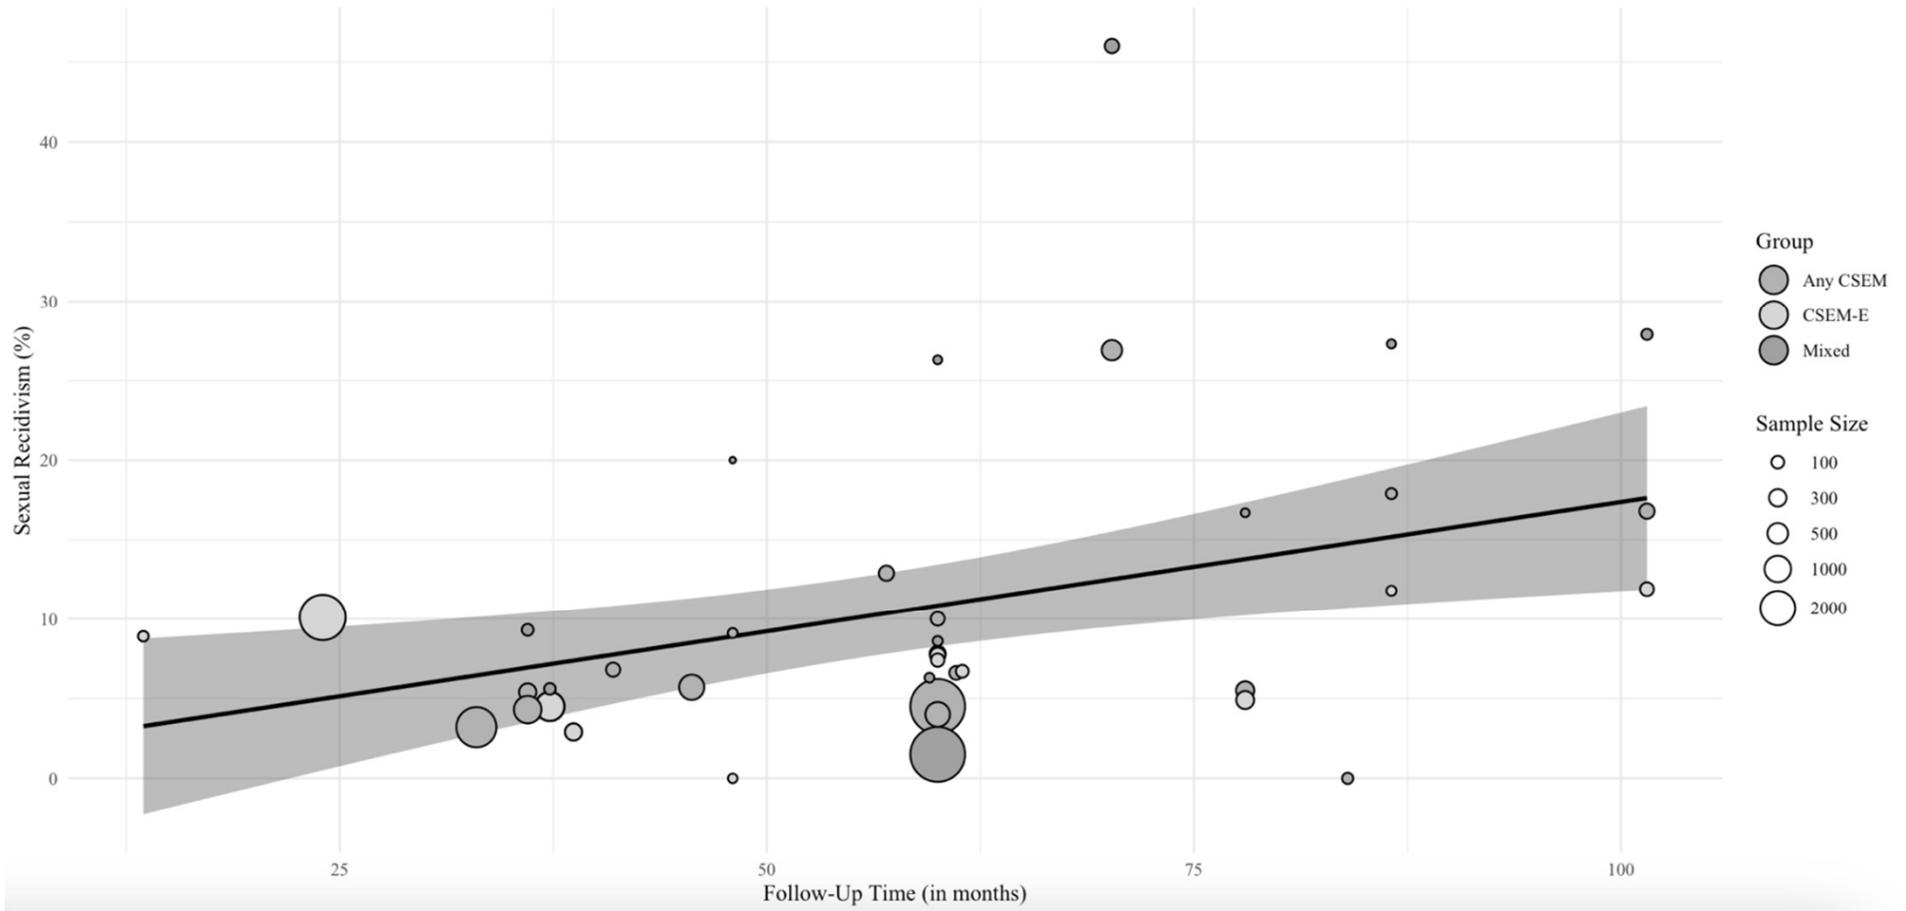

Self-report = 38.3%  
 $N(k) = 275 (4)$

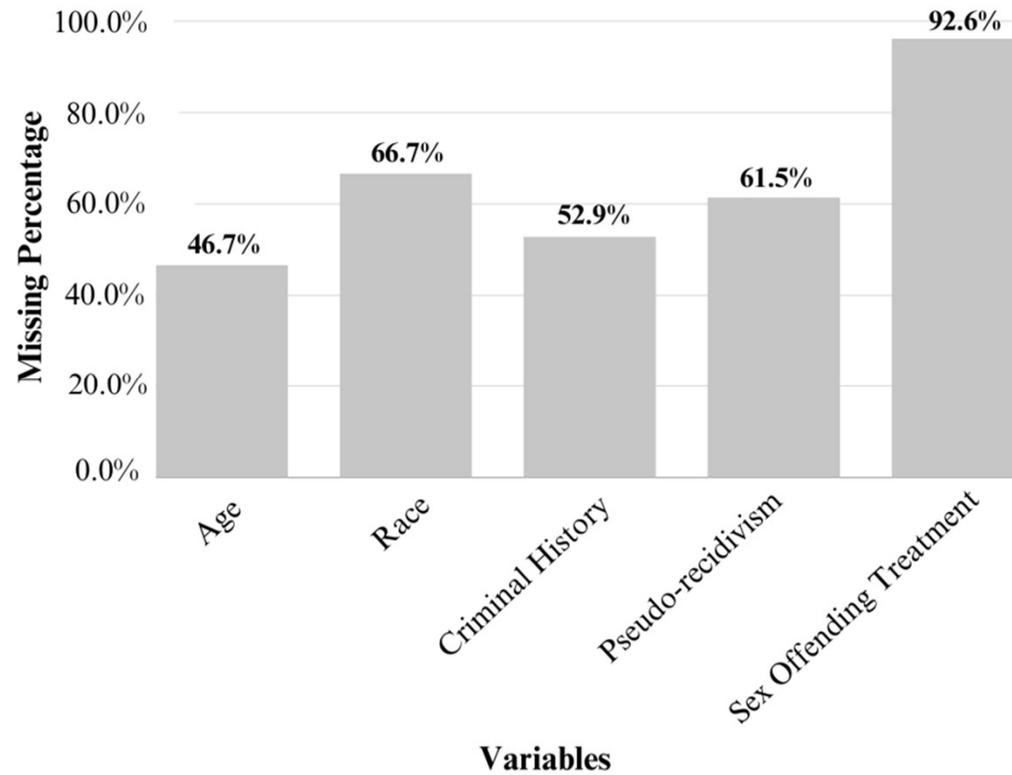

# Self-report studies

- Are recidivism rates really 'that high'?
  - Unique treatment samples
    - No routine sample with this information
- Likely an overestimate

## Meta-Regression of Sexual Recidivism on Follow-up Time

# Key Elements Missing in Recidivism Studies

# Discussion

Reporting

**STROBE**

Strengthening the reporting of observational studies in epidemiology

## Take home message

- Cohort/routine samples: about 2/3 are CSEM-exclusive (about 1/3 mixed)
- After an average 5 years of following, individuals with contact + CSEM offenses are more likely to sexually offend than CSEM exclusive offenses
- CSEM-exclusive: most will not reoffend with a contact sexual offense (0.6%) and instead with another CSEM offense (3.1%)
- Self-report rates are higher than official rates, but the self-report samples are unique (e.g., treatment samples)

Thank you!
